### Problem 4.1

a)

For a relation to be partial order ( $\leq$ )  
we need to prove that is. reflexive, anti symmetric and transitive.

Reflexive

If  $p$  is just a subset of the word  $w$  then  
 $p \subseteq w$

$p \leq p \Rightarrow \exists w \forall p = p$  for all values.

Example.

$\exists w = \text{computer.}$

$p = \text{computer}$  also

$\therefore p = w$

or  $p = p \therefore \text{proved, reflexive}$

set ~~can~~ also be included which in our case is ~~q~~ so,

Anti-symmetric.

$$(p, w) \in E^*, \exists pq = w \wedge w = pq.$$

This can be proven easily as we have said  $p$  is a subset of  $w$  where  $p=w$  and there exists an empty set which in our case is  $q$ , so

$$\therefore p = w \quad \text{and} \quad w = p.$$

Example.

$$w = \text{"Name"} \quad p = \text{"Name"} \quad \text{and} \quad q = \text{" "}$$

$$\begin{aligned} \therefore pq &= w \\ \text{or } p &= w \\ \text{or Name} &= \text{Name} \end{aligned}$$

$$\begin{aligned} \text{and} \quad w &= pq \\ \text{or } w &= p. \quad \therefore \text{proved.} \\ \text{Name} &= \text{Name.} \end{aligned}$$

Transitive.

$$p \leq q \wedge q \leq r \in E^*, \exists p \leq r \quad \text{so}$$

$\exists$  Example,

$$p, \text{Comp}$$

$$q = \text{Computer} \quad r = \text{Computer Systems.}$$

Comp is a prefix of Computer  
or  $p$  is prefix of  $q$ .

Again

"Computer" is prefix of Computer Network.

$\therefore q$  is a prefix of  $r$ .

$\therefore p$  is also a prefix of  $r$ .

$\therefore$  proved Transitive

~~$\therefore$  It~~

$\therefore$  It is a partial order

b) For this question we say  $p$  is a proper prefix of  $w$  such that  $p \neq w$ .

$p \leq p \Rightarrow \exists w \wedge p \neq p$  for all values

Example

$p = \text{Comput}$

$w = \text{computer}$

$p \neq w$

or  $p \neq p$

$\therefore$  irreflexive. proved.

c) we know  $(p, w) \in \leq r$  as well as  $(p, w) \notin r$  so any combination of  $p$  and  $w$  will either be strict partial order or partial order

$(p, w) \in \leq r \vee (p, w) \in \leq \therefore$  It is total.

A-symmetric

$$(p, w) \in E^*; \nexists p \neq w \wedge w \neq pq$$

we have defined  $P$  as a proper subset so  $P$  cannot be equal to  $w$  ~~and~~ even when we include empty set to  $Q$ .

Example.

$w = \text{Hello}$

$p = \text{Hell}$  and  $q = \emptyset$

$$pq \neq w$$

or  $\text{Hell} \neq \text{Hello}$

$\therefore$  It is ~~anti~~ A-symmetric.

Transitive.

$p \neq q \wedge q \neq r \in E^*, \exists p \neq r$  so.

$p = "N"$  and  $q = "Na"$  and  $r = "Name"$ .

"N" is a subset of "Na" so

$p \subset q$

"Na" is a subset of "Name"

$q \subset r$

$\therefore p \subset r$  and  $p \neq r \therefore$  prove a.

Therefore as it is N-symmetric,  
~~irreflexive~~ irreflexive and Transitive it  
is strict partial order.

Problem 4.2

$f: A \rightarrow B$  and  $g: B \rightarrow C$ ,

a)  $g \circ f$  is bijective then  $f$  should be injective  
and  $g$  should be surjective.

Let  $a \in A, b \in B$  and  $c \in C$

There exists  $g(f(a)) = c$

There exists  $a \in A$  with  $g(f(a)) = c$

Then if we take  $b \in f(a) \in B$ ,  $g(b) = c$

As  $c \in C$  is an image of  $g$ ,  $c$  must be mapped by at least one of the elements of  $B$

$g$  is surjective

Consider

$$f(A) = A$$

$$f(B) = B$$

and as we know

$gf$  is bijective all domain of  $a$  should match to  $A$  for it to be bijective.

$\therefore$  All domain of  $a$  match to  $A$  therefore it is ~~bijective~~ injective.

b)  $f: A \rightarrow B$

Injective

Surjective

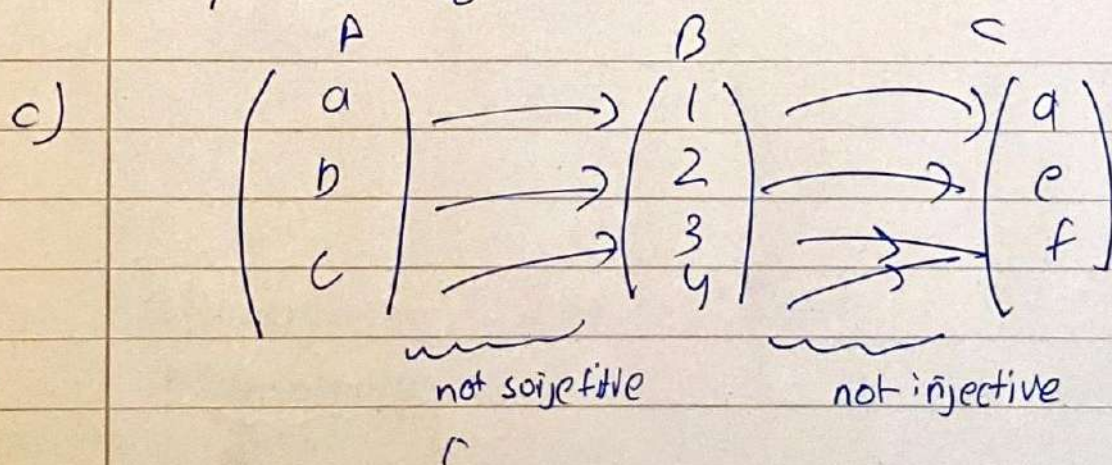

Here

$f: A \rightarrow B$  is injective as every element of  $X$  a value of  $y$  comes.

~~f.g~~  $f: B \rightarrow C$  is surjective as every element in codomain  $Y$  is mapped to one element in  $B$ .

However it is not bijective as every codomain  $Y$  is not matched by one domain  $X$ . look at the alphabet  $a$ .

$F: A \rightarrow B$  is not surjective as every codomain  $B$  is not mapped by one element in  $A$ .

$f: B \rightarrow C$  is not injective as every element  ~~$x$  in~~  $B$  does not have a different  $y$ .

However  $f: A \rightarrow C$  is bijective as every element

if  $A$  is matched exactly by one element in  $C$ .

$A$        $B$        $C$

$\begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix}$	$\begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix}$	$\begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix}$
$\begin{pmatrix} 2 \\ 3 \\ 4 \end{pmatrix}$	$\begin{pmatrix} 2 \\ 3 \\ 4 \end{pmatrix}$	$\begin{pmatrix} 2 \\ 3 \\ 4 \end{pmatrix}$
$\begin{pmatrix} 3 \\ 4 \\ 5 \end{pmatrix}$	$\begin{pmatrix} 3 \\ 4 \\ 5 \end{pmatrix}$	$\begin{pmatrix} 3 \\ 4 \\ 5 \end{pmatrix}$

not injective      not surjective

$C$

$B$

$f: A \rightarrow B$  is not surjective as every

element in  $B$  is not mapped by one element

in  $A$

$f: B \rightarrow C$  is not injective as every element

$x$  in  $B$  does not have a distinct

image in  $C$
